

SYLLABUS

System identification 7.5 credits R7015E

Systemidentifiering

Course syllabus admitted: Autumn 2023 Sp 1 - Present

**DECISION DATE
2021-02-16**

System identification 7.5 credits R7015E

Systemidentifiering

Second cycle, R7015E

Education level
Second cycle

Grade scale
G U 3 4 5

Subject
Reglerteknik

Subject group (SCB)
Automation Technology

Main field of study

Engineering Physics and Electrical Engineering

Entry requirements

Knowledge in the subject of Automatic control, specifically regarding frequency response, state-space form, and state feedback as well as some experience of using Matlab for analysis of control systems. This prerequisite knowledge corresponds to the course R7003E Automatic Control. Some basic level knowledge about probability and statistics, e.g. from the course S0008M Probability Theory and Statistics, is also recommended. Good knowledge in English equivalent to English 6.

Selection

The selection is based on 30-285 credits

Course Aim

The student should be able to:

- formulate and implement algorithms for system identification, i.e. estimation of mathematical models of a dynamic system from input-output data
- formulate and implement algorithms for state estimation, i.e. to infer the status of the internal variables of a dynamic system using measurements of other quantities and some knowledge of the system dynamics
- solve simple instances of system identification and estimation problems by hand
- analyze and prove properties of system identification and estimation algorithms
- apply the above described techniques on real-world processes, and report on this work both orally and in writing.

Contents

The course covers the essentials of two interconnected topics: system identification and state estimation.

System identification is the science dealing with how to model systems starting from collected evidence. Among the statistical sciences, this branch is the one most related to automatic control. Indeed developing a control system usually starts with a system identification step: there is a process to be controlled, but there is either no model for it, or an incomplete model where some parameters are unknown, or maybe there is a model, but it is too complicated for developing a controller (for example a finite element simulator of the thermal dynamics of a whole datacenter, and you want to control the temperature of the racks).

State estimation is instead dealing with reconstructing information on the state of a system starting usually from indirect measurements. For example, gyroscopes are usually subject to some bias, but this bias cannot be measured directly. It is nonetheless possible to infer it indirectly combining knowledge of the dynamics of the system and measurements from the sensors. This state information is then useful for performing automatic control tasks, e.g., feedback from the state.

Realization

Each course occasion's language and form is stated and appear on the course page on Luleå University of Technology's website.

The teaching consists of lectures and problem seminars.

Lab work is performed in groups of no more than two students and accounted for with written reports and a demonstration.

Examination

If there is a decision on special educational support, in accordance with the Guideline Student's rights and obligations at Luleå University of Technology, an adapted or alternative form of examination can be provided. Written examination with differentiated grades and approved lab work.

Unauthorized aids during exams and assessments

If a student, by using unauthorized aids, tries to mislead during an exam or when a study performance is to be assessed, disciplinary measures may be taken. The term "unauthorized aids" refers to aids that the teacher has not previously specified as permissible aids and that may assist in solving the examination task. This means that all aids not specified as permissible are prohibited. The Swedish version has interpretative precedence in the event of a conflict.

Overlap

The course R7015E is equal to R7011E

Course offered by

Department of Computer Science, Electrical and Space Engineering

Modules

Code	Description	Grade scale	Cr	Status	From period	Title
0001	Laboratory work	U G#	3	Mandatory	A18	
0003	Written exam	G U 3 4 5	4.5	Mandatory	A21	

Study guidance

Study guidance for the course is to be found in our learning platform Canvas before the course starts. Students applying for single subject courses get more information in the Welcome letter. You will find the learning platform via My LTU.
